INTERFACE OVERVIEW

This manual describes how to use the GDS-1000A's remote command functionality and lists the command details. The Overview chapter describes how to configure the GDS-1000A USB remote control interface.

Rear Panel Overview

Configuring the USB Interface

USB connection	PC side connector	Type A, host
GDS-1000A side	connector	Type B, slave
Speed	1.1/2.0 (full speed)	

- Panel operation
1. Connect the USB cable to the USB slave port on the rear.
 2. When the PC asks for the USB driver, select dso_cdc_1000.inf which is downloadable from the GW Insteek website, www.gwinstek.com, in the GDS-1000A downloads section.
 3. On the PC, activate a terminal application such as MTTTY (Multi-Threaded TTY). To check the COM port No., see the Device Manager in the PC. For WindowsXP, select Control panel → System → Hardware tab.
 4. Run this query command via the terminal application.
*idn?
This command should return the manufacturer, model number, serial number, and firmware version in the following format.
GW, GDS-1002A, 00000001, V1.00
 5. Configuring the command interface is completed. Refer to the other chapters for more details.

:TRIGger:STATE →(Query)

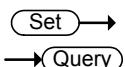

Description Queries the present trigger state.

Syntax < Long > < Short >
:trigger:state? :trig:stat?

Return Parameter	<NR1>	Trigger state
	0	Un-triggered
	1	Triggered

Note This function is designed for triggering with slow time-bases or for single shot events. This query will return 0 before the trigger point and 1 after a trigger point (if any). However with quicker time-bases in auto mode, a periodic waveform is constantly re-sampled and thus re-triggered each time, resulting in the query returning 0 before each trigger. Therefore with quicker time bases, this will usually result in 0 being returned, even if the waveform is shown as triggered.

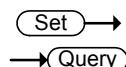

Example :trigger:state?
0 Returns the current trigger state as un-triggered.
